Delay-insensitive directed trace structures satisfy the foam rubber wrapper postulate

Citation for published version (APA):
Delay-insensitive Directed Trace Structures
Satisfy the Foam Rubber Wrapper Postulate

by

This is a series of notes of the Computing Science Section of the Department of Mathematics and Computing Science of Eindhoven University of Technology. Since many of these notes are preliminary versions or may be published elsewhere, they have a limited distribution only and are not for review. Copies of these notes are available from the author or the editor.
Delay-insensitive Directed Trace Structures Satisfy the Foam Rubber Wrapper Postulate

0 Abstract

In [JTU] Udding defines $C_4$, the class of delay-insensitive directed trace structures. Schols defines the foam rubber wrapper postulate in [HS]. This postulate is a formalization of the foam rubber wrapper principle defined by Molnar, Fang, and Rosenberger in [MFR]. In this paper we prove that a directed trace structure that is a $C_4$ satisfies the foam rubber wrapper postulate and has absence of danger of transmission inference (the reverse is proven in [HS]). Furthermore we show that absence of danger of transmission interference, which is explicitly required in the definition of $C_4$, is superfluous in order to prove that a directed trace structure satisfies the foam rubber wrapper postulate.
1 Notations

We explain the notation that we use for variable-binding constructs. Universal quantification is denoted by

\[(A\{l\}:D:E)\]

where \(A\) is the quantifier, \(l\) denotes a list of bound variables, \(D\) denotes a predicate, and \(E\) denotes the quantified expression. \(D\) and \(E\) contain - in general - variables from \(l\). \(D\) indicates the domain of the bound variables. \(E\) is quantified for variable values that satisfy \(D\). Existential quantification is denoted analogously, using quantifier \(E\) instead of \(A\). By

\[\{l\}:D:E\]

we denote the set of all values of \(E\) obtained by substituting for all variables in \(l\) values that satisfy \(D\). By

\[(St\{l\}:D:A)\]

we denote the sum of all elements of \(\{l\}:D:A\), where \(A\) denotes the quantified arithmetic expression. In all notations the domain \(D\) is omitted when obvious from the context.

For expressions \(E\) and \(G\) an expression of the form \(E \Rightarrow G\) is often proved in a number of steps by the introduction of intermediate expressions. For instance, we can prove \(E \Rightarrow G\) by proving \(E = F\) and \(F \Rightarrow G\) for some expression \(F\). In order to prevent that the reader has to perform a string comparison to establish the (for the argument essential) sameness of the two occurrences of \(F\), we represent proofs like this as follows

\[E\]
\[= \{\text{hint why } E = F\}\]
\[F\]
\[\Rightarrow \{\text{hint why } F \Rightarrow G\}\]
\[G\]

These notions have been adopted from \([EWD]\) and \([JTU]\).
2 Trace Theory

2.0 Introduction

We present an introduction to trace theory, which is sufficient for our purposes. An extended description can be found in [MR], [RSU], and [JvdS].

2.0.0 Traces and directed trace structures

An alphabet is a finite set of symbols. For an alphabet $A$, $A^*$ denotes the set of all finite-length sequences of elements of $A$, including the empty sequence, which is denoted by $\epsilon$. A trace is a finite-length sequence of symbols. A directed trace structure $T$ is a triple $<iT,oT,tT>$, where $iT$ is the input alphabet of $T$, $oT$ is the output alphabet of $T$, and $tT$ is the trace set of $T$. $iT$ and $oT$ are disjoint. We denote $iT \cup oT$ by $aT$, the alphabet of $T$. $tT$ is a subset of $(aT)^*$. Elements of $iT$ are called input symbols of $T$, or symbols of type input. Elements of $oT$ are called output symbols of $T$, or symbols of type output. Elements of $tT$ are called traces of $T$.

Note

Unless stated otherwise, small and capital letters near the end of the Latin alphabet denote traces and directed trace structures respectively. Small and capital letters near the beginning of the Latin alphabet denote symbols and alphabets respectively.

end of note

2.0.1 Directed traces and partially directed traces

We may postfix symbols with an exclamation point or a question mark. Symbols $a$, $a!$, and $a?$ are three distinct symbols. For alphabet $A$, $A!$ denotes the set $\{a:a \in A: a!\}$ and $A?$ denotes $\{a:a \in A: a?\}$. $A$, $A!$, and $A?$ are three disjoint sets. Elements of $(A! \cup A?)^*$ are called directed traces and elements of $(A \cup A! \cup A?)^*$ are called partially directed traces. Elements of $A^*$ are referred to as traces. Notice that all traces and all directed traces are partially directed traces. For directed trace structure $T$, $T!?$ denotes $(oT)!\cup(iT)?$. 
2.0.2 Operations

**Definition 2.0 (prefix)**
For partially directed trace $t$ the set of all prefixes of $t$, denoted by $\text{pref}(t)$, is the trace set

$$\{u,w : t = uw : u\}$$

*end of definition*

(Concatenation is denoted by juxtaposition).
We extend this operator to trace sets.

**Definition 2.1 (prefix-closure)**
For trace set $T$ the prefix-closure of $T$, denoted by $\text{pref}(T)$, is the trace set

$$\{t,u : t \in T \land u \in \text{pref}(t) : u\}$$

*end of definition*

We denote the length of a partially directed trace $t$ by $1(t)$:

**Definition 2.2 (length)**
(i) $1(\varepsilon) = 0$
(ii) for partially directed trace $t$ and symbol $a$

$$1(ta) = 1(t) + 1$$

*end of definition*

The projection of a partially directed trace $t$ on an alphabet $A$ is denoted by $t \uparrow A$:

**Definition 2.3 (projection)**
For alphabet $A$
(i) $\varepsilon \uparrow A = \varepsilon$
(ii) for partially directed trace $t$ and symbol $a$, such that $a \in A$, 

$$(ta) \uparrow A = (t \uparrow A)a$$
(iii) for partially directed trace $t$ and symbol $a$, such that $a \not\in A$, 
   \[(t a) \uparrow A = t \uparrow A.\]

end of definition

For a partially directed trace $t$ and a symbol $a$ we denote \( l(t \uparrow \{a\}) \) by \( \#_a t \). We define the function direct, denoted by \( \text{dir} \), which maps partially directed traces on partially directed traces:

**Definition 2.4 (direct)**

For alphabet $A$ and partially directed trace $u$ we define \( \text{dir}(A, u) \) recursively:

(i) \[ \text{dir}(A, \varepsilon) = \varepsilon \]

(ii) for partially directed trace $t$ and symbol $a$, such that $a \in A$,
   \[ \text{dir}(A, ta) = \text{dir}(A, t) a!a? \]

(iii) for partially directed trace $t$ and symbol $a$, such that $a \not\in A$,
   \[ \text{dir}(A, ta) = \text{dir}(A, t) a \]

end of definition

2.0.3 Undirecting

**Definition 2.5 (immediate undirect)**

For partially directed traces $t$ and $u$, $t$ is an immediate undirect of $u$, denoted by $t \text{undirect} u$, iff

\[ (E a, x, y_0, y_1, z \]
   \[ : (y_0 y_1) \uparrow \{a? \} = \varepsilon \]
   \[ : ((t = x y_0 a y_1 z) \land (u = x a! y_0 y_1 a? z)) \lor ((t = x y_0 a y_1) \land (u = x a! y_0 y_1)) \]

)  

end of definition

The reflexive and transitive closure of immediate undirect is a partial order called undirect. We denote this partial order among partially directed traces $t$ and $u$ by $t \text{undirect} u$. 
2.1 Notions related to the FRW-postulate

The notions introduced in this section have been adopted from [HS].

Note
In the remainder of this section $S$ and $T$ denote directed trace structures, such that $iS$ equals $oT$ and $oS$ equals $iT$.
end of note

Definition 2.6 (absence of deadlock)
Traces $s$ and $t$, such that $s \in tS$ and $t \in tT$, have absence of deadlock, denoted by $\text{snodeadlock } t$, iff

$$(\forall a,b,s,o,t: a \in iT \land b \in iS \land s \in \text{pref}(s) \land t \in \text{pref}(t) : \#a s \geq \#a t \lor \#b t \geq \#b s)$$

end of definition

Traces $s$ of $S$ and $t$ of $T$ have absence of deadlock if and only if for all symbols $a$ in $iT$, which equals $oS$, and $b$ in $iS$, which equals $oT$, and for any natural numbers $i$ and $j$, such that $1 \leq i \leq \#a t$ and $1 \leq j \leq \#b s$, in $s$ the $j$-th input of $b$ is preceded by the $i$-th output of $a$ or in $t$ the $i$-th input of $a$ is preceded by the $j$-th output of $b$.

Definition 2.7 (composable)
Traces $s$ and $t$, such that $s \in tS$ and $t \in tT$, are composable, denoted by $c(s,t)$, iff

$$(\forall a : a \in iT : \#a s \geq \#a t) \land (\forall b : b \in iS : \#b t \geq \#b s) \land \text{snodeadlock } t$$

end of definition

A trace of $S$ and a trace of $T$ can be seen as observations of the same communication, if each input occurring in one of them, occurs in the other as output and they have absence of deadlock. Such traces we call composable.
Definition 2.8 (directed resultant)
For a directed trace $x$ and traces $s$ and $t$, such that $s \in sS$, $t \in tT$, and $c(s, t)$, $x$ is a directed resultant of $s$ and $t$, denoted by $x \text{dres}(s, t)$, iff

$((x = \varepsilon) \land (s = \varepsilon) \land (t = \varepsilon))$

$\lor (Ea, s_0, x_0 : (s = s_0 a) \land x_0 \text{dres}(s_0, t) : (a \in oS \Rightarrow (x = x_0 a!)) \land (a \in iS \Rightarrow (x = x_0 a?)))$

$\lor (Ea, t_0, x_0 : (t = t_0 a) \land x_0 \text{dres}(s, t_0) : (a \in oT \Rightarrow (x = x_0 a!)) \land (a \in iT \Rightarrow (x = x_0 a?)))$

end of definition

In a directed resultant $x$ we use $a!$ or $a?$ to indicate that this occurrence of $a$ in $x$ originates from the output alphabet of a directed trace structure or the input alphabet of a directed trace structure respectively. Notice that for each pair of composable traces a set of directed resultants is defined.

Property 2.0
For directed traces $x$ and $y$ and composable traces $s$ and $t$, such that $(xy) \text{dres}(s, t)$, and for symbol $a$

$\#a : x \equiv \#a? x$

end of property

Each input in a directed resultant is preceded by its corresponding output.

Definition 2.9 (resultant)
For traces $s, t, and z$, such that $s \in sS$, $t \in tT$, $z \in (aS \cup aT)^*$, and $c(s, t)$, $z$ is a resultant of $s$ and $t$, denoted by $z \text{res}(s, t)$, iff

$(Ex : z \text{dres}(s, t) : z \text{undirect} x)$

end of definition

Notice that since the alphabets of $S$ and $T$ are equal, $aS \cup aT$ equals $aS$ and $aT$.
For each pair of composable traces a set of resultants is defined. A resultant is a minimal element with respect to the partial order $\text{undirect}$, since a resultant is an element of $(aS \cup aT)^*$. 
**Definition 2.10 (composite)**
The composite of two directed trace structures $S$ and $T$, such that $iS = oT$ and $oS = iT$, which is denoted by $S \otimes T$, is the directed trace structure

$$<iS \cap oT, oS \cap iT, \text{pref}([s, t, z : s \in tS \land t \in tT \land c(s, t) \land res(s, t) : z])>$$

end of definition

For a directed trace structure $T$, $<iT, oT, tT>$, $\overline{T}$ denotes its complement, i.e. $<oT, iT, tT>$.

**Property 2.1**

$$\overline{\overline{T}} = T$$

end of property

**Property 2.2**

$$tT \subseteq t(T \otimes \overline{T})$$

end of property

**Definition 2.11 (foam rubber wrapper postulate)**
A directed trace structure $T$ does justice to the foam rubber wrapper principle, iff

$$T = T \otimes \overline{T}$$

end of definition

For an explanation of our notion of the foam rubber wrapper principle we refer to [HS] and [MFR]. Our notion "foam rubber wrapper principle" equals the notion "FRW-postulate", that Molnar, Fang, and Rosenberger use in [MFR].
2.2 Notions related to $C_4$

The notions introduced in this section have been adopted from [JTU]. $C_4$ is the class of delay-insensitive directed trace structures.

**Definition 2.12 ($C_4$)**
A directed trace structure $T$ is an element of $C_4$ if it satisfies the requirements $R_0$ through $R_5$:

1. $iT \cup oT = aT$
2. $iT$ is prefix-closed and nonempty
3. For trace $s$ and symbol $a \in aT$
   $$sa = tT$$
4. For traces $s$ and $t$, and for symbols $a \in aT$ and $b \in aT$ of the same type
   $$(sabt \in tT) \Rightarrow (sbat \in tT)$$
5. For traces $s$ and $t$, and for symbols $a \in aT$, $b \in aT$, and $c \in aT$
   with $b$ of another type than $a$ and $c$
   $$(sabt \in tT \land sbat \in tT) \Rightarrow (sbac \in tT)$$
6. For trace $s$ and symbols $a \in aT$ and $b \in aT$ of different types
   $$(sa \in tT \land sb \in tT) \Rightarrow (sa \in tT)$$

**Definition 2.13 (from)**
For directed trace structure $T$, and for composable traces $t \in tT$ and $u \in t\bar{T}$ we define $from(t,u)$ as

$$\{ x : x \in (oT \cap i\bar{T})^* \land (Aa : a \in oT \cap i\bar{T} : #a_x = #a_t - #a_u) : x \}$$

end of definition

Since $from(t,u)$ is nonempty and the lengths of the traces in $from(t,u)$ are equal, we define $l(from(t,u))$ as the length of the traces in $from(t,u)$.

**Definition 2.14 (mismatches)**
For directed trace structure $T$, and for composable traces $t \in tT$ and $u \in t\bar{T}$, we define

$$mm(t,u) = l(from(t,u)) + l(from(u,t))$$

end of definition
Property 2.3
For directed trace structure $T$, traces $t_0$, $t_1$, $u_0$, and $u_1$, such that $t_0 \in tT$, $t_1 \in tT$, $u_0 \in t\overline{T}$, $u_1 \in t\overline{T}$, $c(t_0,u_0)$, and $c(t_1,u_1)$, and directed traces $x$ and $y$, such that $x \operatorname{dres}(t_0,u_0)$ and $y \operatorname{dres}(t_1,u_1)$,

$$(\forall a : a \in (T! \cup \overline{T}!)) : \#_a x = \#_a y \Rightarrow (\operatorname{mm}(t_0,u_0) = \operatorname{mm}(t_1,u_1))$$

end of property

Udding uses a definition of composability of traces that differs from our definition, cf. [JTU]. In [HS] is proven that these definitions are equivalent.
3 Directed trace structures that satisfy the foam rubber wrapper postulate

Determining whether a directed trace structure satisfies the foam rubber wrapper postulate, comes to checking whether the resultants of its traces are elements of its trace set. Resultants are obtained by applying directed resultant and immediate undirect operators. In section 3.0 some tools are presented which are used in the subsequent sections. We deal with directed resultant and immediate undirect operations in section 3.1. In section 3.2 mathematical induction on the number of immediate undirect operations is applied. Theorems 3.0 and 3.1 in section 3.3 are conclusions drawn from the results of the previous sections.

Note
For the remainder of this chapter \( U \) denotes a directed trace structure that satisfies \( R_0, R_1, R_3, R_4, \) and \( R_5 \).

end of note

3.0 Preparation

In order to indicate the type of symbols with respect to a directed trace structure we introduce the notion postfix type. Notice that for a symbol \( a, a! \) and \( a? \) are symbols, not concatenations of symbols and an exclamation point or a question mark respectively.

Definition 3.0 (postfix type)
For directed trace structure \( T \) and trace \( t \), such that \( t \epsilon tT \), the trace denoted by \( \text{postf} (T,t) \), in which the symbols in \( t \) are postfixed by their type with respect to \( T \), is defined by:

(i) \( \text{postf} (T,\epsilon) = \epsilon \)

(ii) for trace \( u \) and symbol \( a \), such that \( ua \epsilon tT \) and \( a \epsilon oT \)
\( \text{postf} (T,ua) = \text{postf} (T,u)a! \)

(iii) for trace \( u \) and symbol \( a \), such that \( ua \epsilon tT \) and \( a \epsilon iT \)
\( \text{postf} (T,ua) = \text{postf} (T,u)a? \)

end of definition
Property 3.0 is derived from the definition of directed resultant, composability, and postfix type.

**Property 3.0**
For directed trace structure $T$, composable traces $t$ and $u$, such that $t \in tT$ and $u \in tT$, and directed trace $x$, such that $x \in (T?! \cup \overline{T}?!)^*$,

$$x \text{dres}(t, u) = ((x \uparrow T?! = \text{postf}(T, t)) \land (x \uparrow \overline{T}?! = \text{postf}(\overline{T}, u))$$

$$\land (\forall a, y : y \in \text{pref}(x) : \#a \geq \#a, y)$$

end of property

In lemma 3.0 we deal with absence of danger of computation interference, i.e. all symbols on their way between composable traces can be received. For a definition of these notions we refer to [JTU]. Our notion "absence of danger of computation interference" equals the notion "absence of computation interference" that Udding uses in [JTU].

**Lemma 3.0**
For directed trace structure $T$, that satisfies $R_0, R_1, R_3, R_4,$ and $R_5$, and for composable traces $t$ and $u$, such that $t \in tT$ and $u \in t\overline{T}$,

$$(\forall a : a \in oT \cap i\overline{T} \land (\#a t > \#a u) : ua \in t\overline{T})$$

**Proof**
This is a theorem which is proved by Udding [JTU, p.45 and pp.49-50]; $T$ and $\overline{T}$ satisfy all conditions of connectable directed trace structures except $R_2$; Udding does not use $R_2$ to prove that theorem.

end of lemma

**Note**
Udding refers to $R_2$, [JTU, p.50]. He uses $R_2$ to prove absence of (danger of) transmission interference only, not to prove absence of danger of computation interference.

end of note
3.1 Interchanging adjacent symbols in directed resultants

Lemmata 3.1 and 3.2 deal with interchanging adjacent symbols in directed resultants. In order to derive them we present some properties and lemmata. Properties 3.1.0 and 3.1.1 are derived from property 3.0. Property 3.1.2 is derived from property 3.0 and the definitions of composability, directed resultant, and postfix type.

The occurrences of the symbols interchanged in properties 3.1.0 and 3.1.1 originate from distinct directed trace structures.

Property 3.1.0
For traces \( t \) and \( u \), such that \( t \in tU, u \in tU \), and \( c(t,u) \), directed traces \( x \) and \( y \), and symbols \( a \) and \( b \) of distinct types

\[
\begin{align*}
(xa!b!y)\text{dres}(t,u) &= (xb!a!y)\text{dres}(t,u) \\
(xa?b?y)\text{dres}(t,u) &= (xb?a?y)\text{dres}(t,u)
\end{align*}
\]

end of property

Property 3.1.1
For traces \( t \) and \( u \), such that \( t \in tU, u \in tU \), and \( c(t,u) \), directed traces \( x \) and \( y \), and distinct symbols \( a \) and \( b \) of the same type

\[
(xa!b?y)\text{dres}(t,u) = (xb?a!y)\text{dres}(t,u)
\]

end of property

Property 3.1.2 expresses that prefixes of directed resultants of composable traces be directed resultants of composable prefixes of those traces.

Property 3.1.2
For traces \( t \) and \( u \), such that \( t \in tU, u \in tU \), and \( c(t,u) \), and directed trace \( x \), such that \( x \text{dres}(t,u) \),

\[
\begin{align*}
(\forall x_0 : x_0 \in \text{pref}(x)) \\
&:\left( \forall t_0, u_0 : t_0 \in \text{pref}(t) \land u_0 \in \text{pref}(u) \\
&\land (x_0 \uparrow U? = \text{postf}(U,t_0)) \land (x_0 \uparrow U!? = \text{postf}(U,u_0)) \\
&\land c(t_0,u_0) \land x_0 \text{dres}(t_0,u_0)\right)
\end{align*}
\]

end of property
In lemmata 3.1.0 and 3.1.1 we deal with interchanging occurrences, that originate from the same directed trace structure, of symbols of the same type. In lemma 3.1.0 we treat occurrences, that originate from the directed trace structure in which the symbols are outputs.

**Lemma 3.1.0**

For directed traces \( x \) and \( y \), such that \( xy \in (U! ? \cup \overline{U! ?})^* \), and symbols \( a \) and \( b \) of the same type

\[
\Phi_{0,0}: t \in tU \land u \in t \overline{U} \land c(t, u_0): ( xa!b!y ) \text{dres}(t, u_0) \\
\end{align*}

\[
= ( Et, u : t \in tU \land u \in t \overline{U} \land c(t, u) : ( zb!a!y ) \text{dres}(t, u) )
\]

**Proof**

Given directed traces \( x \) and \( y \), such that \( xy \in (U! ? \cup \overline{U! ?})^* \), and symbols \( a \) and \( b \), such that \( a \in oU \) and \( b \in oU \). We derive:

\[
\Phi_{0,0}: t \in tU \land u \in t \overline{U} \land c(t, u_0): ( xa!b!y ) \text{dres}(t, u_0) \\
\]

\[
= \{ \text{property 3.0, definition of directed resultant, and calculus} \}
\]

\[
( Et, u_0 : t \in tU \land u \in t \overline{U} : ( xa!b!y ) \text{dres}(t, u_0) ) \\
\]

\[
= \{ \text{calculus, } a \in (oU)!, \text{ and } b \in (oU) ! \}
\]

\[
( Et, t, t_0, u_0 : t \in tU \land u \in t \overline{U} : ( t_0 = t_1 \overline{ab} t_2 ) \land ( z \overline{U} \ = \text{postf}(U, t_1) ) \\
\]

\[
= \{ \text{calculus, property 3.0, and definition of directed resultant} \}
\]

\[
( Et, u : t \in tU \land u \in t \overline{U} : ( zb!a!y ) \text{dres}(t, u) )
\]

For symbols \( a \) en \( b \), such that \( a \in oU \) and \( b \in oU \), the proof is analogous.

**end of lemma**
Lemma 3.1.1 is the counterpart of lemma 3.1.0: occurrences, that originate from the directed trace structure in which the symbols are input symbols, are treated.

**Lemma 3.1.1**
For directed traces $x$ and $y$, such that $xy \in (U! ? \cup \overline{U}! ?)^*$, and symbols $a$ and $b$ of the same type

$$(Et_0,u_0:t_0 \in tU \land u_0 \in \overline{tU} \land e(t_0,u_0):(xa?b?y)dres(t_0,u_0))$$

$$= (Et,u:t \in tU \land u \in \overline{tU} \land e(t,u):(xb?a?y)dres(t,u))$$

The proof of this lemma is analogous to the proof of lemma 3.1.0.

**end of lemma**

Lemma 3.1.2 deals with interchanging occurrences, that originate from the same directed trace structure, of symbols of distinct types in one way: output backward and input forward.

**Lemma 3.1.2**
For directed traces $x$ and $y$, such that $xy \in (U! ? \cup \overline{U}! ?)^*$, and symbols $a$ and $b$ of distinct types

$$(Et_0,u_0:t_0 \in tU \land u_0 \in \overline{tU} \land e(t_0,u_0):(xa!b?y)dres(t_0,u_0))$$

$$\Rightarrow (Et,u:t \in tU \land u \in \overline{tU} \land e(t,u):(xb?a!y)dres(t,u))$$

**Proof**
We prove this lemma by mathematical induction on the length of $y$. Given directed traces $x$ and $y$, such that $xy \in (U! ? \cup \overline{U}! ?)^*$, and symbols $a$ and $b$, such that $a \in O U$ and $b \in I U$.

**Induction hypothesis**

$$( \forall y : 1(y_0) < 1(y) : (Et_0,u_0:t_0 \in tU \land u_0 \in \overline{tU} \land e(t_0,u_0):(xa!b?y_0)dres(t_0,u_0))$$

$$\Rightarrow (Et,u:t \in tU \land u \in \overline{tU} \land e(t,u):(xb?a!y_0)dres(t,u))$$

)
Base: \( I(y) = 0 \)

We derive:

\[
(E_{t_0,u_0}: t_0 \subseteq U \wedge u_0 \subseteq \overline{U} \wedge c(t_0,u_0): (xa!b?y \ dres(t_0,u_0))
\]

\[
= \{ \ y = \epsilon, \text{ since } I(y) = 0 \ \}
\]

\[
(E_{t_0,u_0}: t_0 \subseteq U \wedge u_0 \subseteq \overline{U} \wedge c(t_0,u_0): (xa!b? \ dres(t_0,u_0))
\]

\[
= \{ \ \text{calculus and property 3.0} \ \}
\]

\[
(E_{t_0,u_0}: t_0 \subseteq U \wedge u_0 \subseteq \overline{U} \wedge c(t_0,u_0)
\]

\[
:\ ((xa!b?) \ \overline{U}\wedge (\neg (xa!b?) \ \overline{U}\wedge (\neg \neg I(y) = \neg \neg \neg \neg \text{calculus and property 3.0} \ \}
\]

\[
(E_{t_0,u_0}: t_0 \subseteq U \wedge u_0 \subseteq \overline{U} \wedge c(t_0,u_0)
\]

\[
:\ ((xa!b?) \ \overline{U}\wedge (\neg (xa!b?) \ \overline{U}\wedge (\neg \neg I(y) = \neg \neg \neg \neg \neg \text{calculus, } a \in (aU), b \in (iU), \text{ and definition of composability} \}
\]

\[
(E_{t_0,t_1,u_0}: t_0 \subseteq U \wedge t_1 = t_1 \ ab \wedge u_0 \subseteq \overline{U} \wedge c(t_1,u_0)
\]

\[
\wedge (xa!b?) \ dres(t_1,u_0)
\]

\[
\Rightarrow \{ \ \text{property 3.1.2 and calculus} \ \}
\]

\[

For symbols $a$ and $b$, such that $a \in oU$ and $b \in iU$, the proof is analogous.
Lemma 3.1

For symbol $a$, such that $a \in aU$, and partially directed traces $y_0, y_1, y_2$, and $y_3$, such that $(y_0,y_1,y_2,y_3) \in (aU \cup U! \cup U!)^*$ and $(y_1,y_2) \{a\} = \varepsilon$,

$$(E_{t_0,u_0} : t_0 \in tU \wedge u_0 \in t\bar{U} \wedge c(t_0,u_0) : (\text{dir}(aU,y_0a!y_1a!y_2a!y_3)) \text{dres}(t_0,u_0))$$

$$\Rightarrow (E_{t,u} : t \in tU \wedge u \in t\bar{U} \wedge c(t,u) : (\text{dir}(aU,y_0a!y_1a!y_2a!y_3)) \text{dres}(t,u))$$

Proof

Given $a, y_0, y_1, y_2$, and $y_3$, such that $a \in aU, (y_0,y_1,y_2,y_3) \in (aU \cup U! \cup U!)^*$, and $(y_1,y_2) \{a\} = \varepsilon$. For shortness we introduce some abbreviations: $x_0, x_1,$ and $x_2$ denote $\text{dir}(aU,y_0), \text{dir}(aU,y_1),$ and $\text{dir}(aU,y_2a!y_3)$ respectively. We proof this lemma by mathematical induction on the length of $x_1$.

Induction hypothesis

$$(Aw_0,w_1 : (w_0w_1 = x_1) \wedge l(w_0) < l(x_1))$$

$$:(E_{t_0,u_0} : t_0 \in tU \wedge u_0 \in t\bar{U} \wedge c(t_0,u_0) : (x_0a!w_0w_1x_2) \text{dres}(t_0,u_0))$$

$$\Rightarrow (E_{t,u} : t \in tU \wedge u \in t\bar{U} \wedge c(t,u) : (x_0w_1a!w_2) \text{dres}(t,u))$$

Base : $l(x_1) = 0$

We derive:

$$(E_{t_0,u_0} : t_0 \in tU \wedge u_0 \in t\bar{U} \wedge c(t_0,u_0) : (\text{dir}(aU,y_0a!y_1a!y_2a!y_3)) \text{dres}(t_0,u_0))$$

$$= \{ \text{definitions of direct, } x_0, x_1, \text{ and } x_2, \text{ using } a \not\in aU \}$$

$$(E_{t_0,u_0} : t_0 \in tU \wedge u_0 \in t\bar{U} \wedge c(t_0,u_0) : (x_0a!x_1x_2) \text{dres}(t_0,u_0))$$

$$= \{ x_1 = \varepsilon, \text{ since } l(x_1) = 0 \}$$

$$(E_{t_0,u_0} : t_0 \in tU \wedge u_0 \in t\bar{U} \wedge c(t_0,u_0) : (x_0a!x_1x_2) \text{dres}(t_0,u_0))$$

Step : $l(x_1) > 0$

We derive:

$$(E_{t_0,u_0} : t_0 \in tU \wedge u_0 \in t\bar{U} \wedge c(t_0,u_0) : (\text{dir}(aU,y_0a!y_1a!y_2a!y_3)) \text{dres}(t_0,u_0))$$

$$\wedge (E_{w,b} : b \in (U! \cup U!) : x_1 = wb)$$

$$= \{ \text{definitions of direct, } x_0, x_1, \text{ and } x_2, \text{ using } a \not\in aU \}$$

$$(E_{b,t_0,u_0,w} : b \in (U! \cup U!) \wedge t_0 \in tU \wedge u_0 \in t\bar{U} \wedge c(t_0,u_0) \wedge (x_1 = wb)$$

$$(x_0a!wbx_2) \text{dres}(t_0,u_0))$$

$$\Rightarrow \{ \text{induction hypothesis} \}$$

$$(E_{b,t_1,u_1,w} : b \in (U! \cup U!) \wedge t_1 \in tU \wedge u_1 \in t\bar{U} \wedge c(t_1,u_1) \wedge (x_1 = wb)$$

$$(x_0a!wbx_2) \text{dres}(t_1,u_1))$$

end of case
Case (0.4): $b \in (iU)$?

$$(Eb,c,t_1,u_1,w : (b = c? ) \wedge c \in iU \wedge t_1 \in tU \wedge u_1 \in tU \wedge c(t_1.u_1) \wedge (x_1 = wb) : (x_0.wa!c?x_2)\mathbf{dres}(t_1,u_1))$$

$$\Rightarrow \{ \text{lemma 3.1.1 using } a \text{ and } c \text{ have distinct types, and calculus} \}$$

$$(Ec,t,u,w : c \in iU \wedge t \in tU \wedge u \in tU \wedge c(t,u) \wedge (x_1 = wc?) : (x_0.wc?a!x_2)\mathbf{dres}(t,u))$$

$$= \{ \text{calculus} \}$$

$$(Et,u : t \in tU \wedge u \in tU \wedge c(t,u) : (x_0.x_1a!x_2)\mathbf{dres}(t,u))$$

end of case

end of case

Case (1): $a \in oU$

The proof of this case is analogous to the proof of case (0).

end of case

end of lemma

Lemma 3.2

For symbol $a$, such that $a \in aU$, and partially directed traces $y_0$, $y_1$, $y_2$, and $y_3$, such that $(y_0y_1y_2y_3)\in (aU \cup U! ? \cup U! ?)^*$ and $(y_1y_2)\{a? \} = \varepsilon$,

$$(Et_0,u_0 : t_0 \in tU \wedge u_0 \in tU \wedge c(t_0,u_0) : (\mathbf{dir}(aU,y_0a!y_1a?y_3))\mathbf{dres}(t_0,u_0))$$

$$\Rightarrow (Et,u : t \in tU \wedge u \in tU \wedge c(t,u) : (\mathbf{dir}(aU,y_0a!y_1a?y_2y_3))\mathbf{dres}(t,u))$$

Using lemma 3.1.1 instead of lemma 3.1.0 the proof of this lemma is analogous to the proof of lemma 3.1.

end of lemma
3.2 Undirecting directed resultants

In order to derive lemma 3.3 we define the notion $D$. It can be interpreted as the distance between two partially directed traces, that are ordered by the partial order undirect.

**Definition 3.2.0 ($D$)**
For partially directed traces $x$ and $y$, such that $y$ undirect $x$,

$$D(x, y) = (\text{Sa} : #a x - #a y)$$

end of definition

**Property 3.2.0**

(i) $D(x, y) \geq 0$

(ii) ($D(x, y) = 0$) $\iff (x = y)$

(iii) $y$ undirect $x$ $\iff (D(x, y) = 1)$

(iv) ($z$ undirect $y$ $\land y$ undirect $x$) $\iff (D(x, y) + D(y, z) = D(x, z))$

end of property

**Lemma 3.3**

For traces $t$ and $u$, such that $t \in tU$, $u \in t\bar{U}$, $c(t, u)$, and $\mu(t, u) = 0$, and partially directed traces $x$ and $y$, such that $x$ dres$(t, u)$ and $y$ undirect $x$,

$$(\text{Et}_{t_0, u_0} : t_0 \in tU \land u_0 \in t\bar{U} \land c(t_0, u_0) \land (\mu(t_0, u_0) = 0) : (\text{dir}(aU, y)) \text{dres}(t_0, u_0))$$

**Proof**

Given $t$, $u$, and $z$, such that $t \in tU$, $u \in t\bar{U}$, $c(t, u)$, $\mu(t, u) = 0$, and $x$ dres$(t, u)$. We proof this lemma for partially directed trace $y$, such that $y$ undirect $z$, by mathematical induction on $D(x, y)$. Given $y$, such that $y$ undirect $z$.

**Induction hypothesis**

$$(Ax : z \text{ undirect } z \land D(x, z) < D(x, y))$$

$$(\text{Et}_{t_0, u_0} : t_0 \in tU \land u_0 \in t\bar{U} \land c(t_0, u_0) \land (\mu(t_0, u_0) = 0) : (\text{dir}(aU, z)) \text{dres}(t_0, u_0))$$

**Base** : $D(x, y) = 0$

We derive :
\[ D(x, y) = 0 \]
\[ \{ \text{property 3.2.0 (ii) and } x \text{ dres}(t, u) \} \]
\[ (x = y) \land x \text{ dres}(t, u) \]
\[ \{ \text{calculus} \} \]
\[ y \text{ dres}(t, u) \]
\[ \{ y = \text{dir}(aU, y) \text{ due to the definitions of direct and directed resultant} \} \]
\[ (\text{dir}(aU, y)) \text{ dres}(t, u) \]
\[ \{ \text{calculus, using } mm(t, u) = 0 \} \]
\[ (Et_0, u_0 : t_0 e t U \land u_0 e t \overline{U} \land c(t_0, u_0) \land (mm(t_0, u_0) = 0) : (\text{dir}(aU, y)) \text{ dres}(t_0, u_0)) \]

**Step:** \( D(x, y) > 0 \)

We derive:

\[ D(x, y) > 0 \]
\[ \{ \text{definition of } D, \text{ definition of immediate undirect, } \}
\[ \text{definition of undirect, } x \text{ dres}(t, u), \text{ and calculus} \} \]

\[ (Et_0, u_0, x : t_0 e t U \land u_0 e t \overline{U} \land c(t_0, u_0) \land (mm(t_0, u_0) = 0) \land y \text{ undirect } z : x \text{ dres}(t, u)) \]
\[ \{ \text{property 3.2.0 (iii) and (iv), and definition of immediate undirect} \} \]
\[ (Et_0, u_0, z : t_0 e t U \land u_0 e t \overline{U} \land c(t_0, u_0) \land (mm(t_0, u_0) = 0) \land y \text{ undirect } z \land D(x, z) < D(x, y) : x \text{ dres}(t, u)) \]
\[ \Rightarrow \{ \text{induction hypothesis} \} \]
\[ (Et_0, u_0, z : t_0 e t U \land u_0 e t \overline{U} \land c(t_0, u_0) \land (mm(t_0, u_0) = 0) \land y \text{ undirect } z \land D(x, z) \land (\text{dir}(aU, z)) \text{ dres}(t_0, u_0)) \]
\[ \Rightarrow \{ \text{definition of immediate undirect using } mm(t_0, u_0) = 0 \} \]
\[ (Et_0, u_0, z : t_0 e t U \land u_0 e t \overline{U} \land c(t_0, u_0) \land (mm(t_0, u_0) = 0) \land (\text{dir}(aU, z)) \text{ dres}(t_0, u_0)) \]
\[ \land ((Ea, y_0, y_1, y_2, y_3 : (y_1 y_2) \land \{ a? \} = e : y = y_0 y_1 c y_2 y_3) \land (z = y_0 a! y_1 y_2 a? y_3)) \]
\[ \Rightarrow \{ \text{lemmata 3.1 and 3.2, and calculus} \} \]
\[ (Ea, t, t_0, u, y_0, y_1, y_2, y_3 : a e aU \land u e t \overline{U} \land c(t, u) \land t_0 e t U \land u_0 e t \overline{U} \land c(t_0, u_0) \land (mm(t_0, u_0) = 0) \land (y_1 y_2) \land \{ a? \} = e) \]
\[ \land ((Ea, y_0, y_1, y_2, y_3) \text{ dres}(t_0, u_0) \land (\text{dir}(aU, y_0 a! y_1 y_2 a? y_3)) \text{ dres}(t, u)) \]
\[ \Rightarrow \{ \text{property 2.3, and calculus} \} \]
\[ (Et, u : t e t U \land u e t \overline{U} \land c(t, u) \land (mm(t, u) = 0) : (\text{dir}(aU, y)) \text{ dres}(t, u)) \]

end of lemma
3.3 Concluding theorems

Theorem 3.0
Every directed trace structure $U$, that satisfies $R_1$, $R_3$, $R_4$, and $R_5$ satisfies the foam rubber wrapper postulate.

Proof
Given a directed trace structure $U$, such that $U$ satisfies $R_1$, $R_3$, $R_4$, and $R_5$, traces $t$, $u$, and $z$, such that $t \in tU$, $u \in t\overline{U}$, $c(t,u)$, $z \in (aU)^*$, and $z \text{res}(t,u)$.

We derive:

true

$= \{ \text{lemma 3.0, definition of mismatches, and } z \text{res}(t,u) \}$

$(Et_0,u_0: t_0 \in tU \land u_0 \in t\overline{U} \land c(t_0,u_0) \land (\text{mm}(t_0,u_0) = 0):(z \text{res}(t_0,u_0))$

$= \{ \text{definition of resultant} \}$

$(Et_0,u_0,z: t_0 \in tU \land u_0 \in t\overline{U} \land c(t_0,u_0) \land (\text{mm}(t_0,u_0) = 0) : z \text{ undirect } x \land z \text{dres}(t_1,u_1)$

$\Rightarrow \{ \text{lemma 3.3} \}$

$(Et_1,u_1: t_1 \in tU \land u_1 \in t\overline{U} \land c(t_1,u_1) \land (\text{mm}(t_1,u_1) = 0): (\text{dir}(aU,z)) \text{dres}(t_1,u_1))$

$\Rightarrow \{ \text{property 3.0} \}$

$(Et_1: t_1 \in tU: \text{dir}(aU,z) \mid(aU)! = \text{postf}(U,t_1))$

$= \{ z \in (aU)^*, \text{and definitions of postfix type, direct, and projection} \}$

$(Et_1: t_1 \in tU: z = t_1)$

$= \{ \text{calculus} \}$

$z \in tU$

We conclude, since $tU$ is prefix-closed due to $R_1$, that $t(U \otimes U) \subseteq tU$. Using property 2.2 we conclude that $U$ satisfies the foam rubber wrapper postulate.

end of theorem

Theorem 3.1
Every directed trace structure that is a $C_4$, satisfies the foam rubber wrapper postulate and has absence of danger of transmission interference.

Proof
In the context of delay-insensitive directed trace structures absence of danger of transmission interference equals $R_2$. A directed trace structure, that is a $C_4$, satisfies the foam rubber wrapper postulate on account of theorem 3.0, and has absence of danger of transmission interference on account of $R_2$.
