Publisher's PDF, also known as Version of Record (includes final page, issue and volume numbers)

**Please check the document version of this publication:**

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

## On the Influence of Coding on the Mean Time to Failure for Degrading Memories with Defects

Han Vinck and Karel Post  
Eindhoven University of Technology  
Eindhoven, POB 513, The Netherlands

We study the application of a combined test- error-correcting procedure to improve the Mean Time to Failure (MTTF) for degrading memory systems with defects (hard errors). The degrading is characterized by the probability  $\rho$  that in a unit of time a memory cell turns over from the correct physical state to the permanent defect state. We give bounds on the MTTF and show that coding gives an improvement in performance proportional to  $N^{(d_{min}-2)/(d_{min}-1)}$ , where  $d_{min}$  is the minimum distance of the code used and  $N$  the size of the memory in words. For small probabilities  $\rho$ , the MTTF is proportional to  $N^{-1/(d_{min}-1)}$ . Thus the time gain for a simple minimum distance 3 code is proportional to  $\sqrt{N}$ . In addition we combine a memory-word-test with a simple defect-matching code. This method enables reliable operation with one defect in a word. The code efficiency is  $(n-2)/n$ , where  $n$  is the word length.
