Publisher's PDF, also known as Version of Record (includes final page, issue and volume numbers)

Please check the document version of this publication:

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

Long-Range Piezo Actuators:

Compensating Hysteresis and Commutation Angle Reproducible Disturbances

Abstract

Piezo-stepper actuators consist of piezo elements that are able to displace a mover over an infinite stroke through walking while maintaining the high accuracy and high stiffness properties of the piezo elements. In Figure 1, a schematic representation of a piezo-stepper actuator is depicted.

Two key challenges when implementing a piezo-stepper actuator include:

1. Dealing with the nonlinear hysteresis, which is inherent due to the nature of the piezo elements.
2. Dealing with disturbances introduced by the walking behaviour.

Regarding 1, due to the hysteric behaviour depending on past input profiles, direct compensation exploiting an inverse-model feedforward is typically hard. To overcome this, we have developed a new intuitive feedforward approach, exploiting the unique inverse of a hybrid MEM-element.

Regarding 2, the disturbance introduced by the walking behaviour is not reproducible in the time domain. However, this disturbance is highly reproducible in the position domain. We have developed a new data-driven approach based on iterative learning control that can effectively compensate for this type of disturbances, see [1] for details.
