Published: 01/01/2016

Document Version:
Publisher's PDF, also known as Version of Record (includes final page, issue and volume numbers)

Please check the document version of this publication:

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

What is the role of the flow in non-thermal atmospheric pressure plasma jets operating in ‘bullet mode’? What is the influence of the target? How do they affect fundamental plasma properties such as electric field profile along the plasma plume? The answers are relevant both for the understanding of the processes in atmospheric pressure non-thermal plasmas and for the applications on materials sensitive to high temperatures, (bio)materials that are not resistant to vacuuming or even fully drying, (bio)targets that are sensitive to significant current transfer.

This paper will give an overview of the recent work in the electric field measurements in atmospheric pressure plasma jets that operate in the bullet mode. A kHz-driven jet in helium is used with flow rates up to 2 SLM, like the one reported on in [1].
