Document Version:
Publisher’s PDF, also known as Version of Record (includes final page, issue and volume numbers)

Please check the document version of this publication:
• A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
• The final author version and the galley proof are versions of the publication after peer review.
• The final published version features the final layout of the paper including the volume, issue and page numbers.

**Motivation**

Non-thermal and low temperature plasmas in air or gas mixtures at atmospheric pressure are very efficient sources of active species (radicals, excited species, charged particles, photons emission, etc.).

The main objective of this project is to investigate the effectiveness of using non-thermal plasma to enhance the combustion characteristics through the following:

- Radical and species production
- Thermal enhancement
- Increasing burning velocity
- Reducing emissions

**DBD Microplasma Flow Reactor**

In this work, we introduce a new geometry to generate a two layers of a stable non-thermal plasma discharge in a DBD micro-holes structure for gas flow applications at atmospheric pressure.

**Experimental Setup**

The schematic representation of the experimental setup is shown in figure 3.

**Experimental Results**

**Electrical pulse characteristics**

- A peak voltage and current of $4kV$ and $40A$ have been measured and a pulse energy of $1mJ$ has been calculated for plasma discharge at atmospheric pressure.
- Two power waves separated by $40ns$ are recorded, and they agree with the spectroscopic measurements.

**Discharge temperatures**

- Plasma discharge in microplasma reactor has a vibrational and rotational temperatures of $3460$ K and $550$ K respectively at atmospheric pressure.
- Temperature measurements done by comparing the broadening of the emission lines of the second positive system for $N_2 (C-B) \rightarrow$ with the Specair code.
- High level of non-equilibrium discharge has been reported.

**Effect of plasma on burning velocity**

- Burning velocity measurements have been done by measuring the angle of a conical flame.
- The graph shows an increasing of the burning velocity as a result of plasma effect.
- In atmospheric pressure, most of the enhancement is due to thermal effect of the discharge.

**Future Work**

- Using Raman spectroscopic technique to investigate the plasma discharge effect on flame chemistry.
- Studying the effect of pressure on the plasma emission and flame chemistry.
- Studying the effect of plasma discharge on NOx and CO emissions at different working pressures.
