_Document Version:_
Publisher’s PDF, also known as Version of Record (includes final page, issue and volume numbers)

_Please check the document version of this publication:_
• A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher’s website.
• The final author version and the galley proof are versions of the publication after peer review.
• The final published version features the final layout of the paper including the volume, issue and page numbers.

Nitrogen Fixation by Gliding Arc Plasma: Better Insight by Chemical Kinetics Modelling

What prompted you to investigate this topic/problem?
Considering the increasing demand of fertilizers as well as the high-energy intensity and environmental concerns triggered by industrial nitrogen fixation (i.e., the Haber–Bosch process), there is an urgent need to develop and integrate more sustainable processes of nitrogen fixation. Gliding arc plasma-based nitric oxide synthesis offers unique perspectives for this purpose, but the underlying mechanisms are clearly not yet understood. Hence, we wanted to elucidate the plasma chemistry by a combination of experiments and computations, to provide the necessary insights for gliding arc plasma-based nitrogen fixation. Our work also allows us to propose possible solutions on how to further improve the performance of gliding arc plasma technology.

What is the most significant result of this study?
Our results clearly reveal that vibrational excitation of $N_2$ can help to overcome the reaction energy barrier of the non-thermal Zeldovich mechanism $O + N_2(V) \rightarrow NO + N$ and can thus significantly enhance the nitric oxide synthesis in the gliding arc plasma. This provides an energy efficient pathway for nitrogen fixation using air as raw material.

What future opportunities do you see (in the light of the results presented in this paper)?
If electricity from sustainable energy sources (wind and solar) is used, the intrinsic potential of gliding arc plasma-based nitrogen fixation can provide a promising opportunity for producing nitrogenous fertilizer in remote locations by just using small-scale plants, which offer farmers a new source of revenue from their land. This helps to come up with realistic scenarios of entering a cutting-edge innovation in new business cases of plasma agriculture, in which low-temperature plasma technology might play an important role.
