Publisher Version:
Publisher’s PDF, also known as Version of Record (includes final page, issue and volume numbers)

Please check the document version of this publication:

• A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher’s website.
• The final author version and the galley proof are versions of the publication after peer review.
• The final published version features the final layout of the paper including the volume, issue and page numbers.

How Creative is the Crowd in Describing Smart Home Scenarios?

Tahir Abbas¹,²; Vassilis-Javed Khan¹; Daniel Tetteroo¹; Panos Markopoulos¹
¹Eindhoven University of Technology, Eindhoven, the Netherlands, ²Mirpur University of Science & Technology (MUST), Mirpur-10250, AJK Pakistan

Abstract

Internet of Things (IoT) is recently attracting vendors that have already brought to the market a plethora of IoT devices. However, according to recent studies:

• End-users face difficulties in conjuring up meaningful use scenarios that combine IoT devices
• Information provided by IoT vendors on their websites does not help consumers to translate their high-level goals to useful scenarios

We present an on-going investigation that explores the potential of sourcing IoT-relevant scenarios from a popular microtask-crowdsourcing platform, and a preliminary evaluation of such scenarios with respect to their originality and practicality.

Motivation

Our main motivation was to check the feasibility of a pipeline where end-users can select some smart home devices and then system generate several IoT scenarios in various categories based on selected devices.

However, there are several questions that arise:

• Where should these pre-defined scenarios come from?
• How can vendors anticipate and gather useful scenarios and provide them on their websites?
• How can inexperienced inhabitants, who are already living in smart homes and want to grow their system with new devices, get useful ideas?

In this research we examine whether crowdsourcing could be a suitable approach to collecting and organizing such scenarios.

Methods and Materials

(Step 1) Generate Scenarios (306)
By crowd through Mturk (102)
(Step 2) Creativity Evaluation (40)
By experts (2)
(Step 3) Identification of Properties (e.g. word count, devices count etc.)
(Step 4) Similarity Measures
By TF-IDF and Cosine Similarity
(Step 5) Reporting determinants of Creativity

Two independent experts evaluated the creativity of randomly selected scenarios on a two 7-point Likert scales using the binary measures of creativity (an idea should be both original and potentially practical)

Cosine similarity is a vector-based measure of the similarity of two strings. In this method, we transform each string into a high dimensional vector space in which strings which are closer to each other are considered more similar and vice versa

Correlates of Originality and Practicality:

<table>
<thead>
<tr>
<th></th>
<th># of Action devices</th>
<th># of words</th>
<th># of actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Originality</td>
<td>0.34*</td>
<td>0.42**</td>
<td></td>
</tr>
<tr>
<td>Practicality</td>
<td>0.38**</td>
<td>0.47**</td>
<td>0.40**</td>
</tr>
</tbody>
</table>

We also found a weak inverse correlation between subjective evaluation of originality by experts and objective evaluation by cosine based similarity measures (r=-0.10, p = 0.542).

Results

Categories:
Distribution of categories in which workers classified their scenarios. It closely resembles a bimodal distribution with Home Security and Comfort topping the list. The Other category includes user defined categories e.g. Pet Care, Entertainment, Child Care and Cleaning.

Smart Home Exp. 48.6% had smart home experience

We found that the overall creativity increased with each subsequent scenario χ² (1, N = 40) = 5.06, p<0.05

Conclusions

• In this paper, we reported some preliminary results based on the analysis that we conducted on a data set of IoT application scenarios collected with MTurk.
• We evaluated these scenarios on various dimensions finding interesting correlations between creativity and different features of scenarios like word count, number of devices used and their actions, and the order in which workers wrote scenarios.

Future Work

• In Future, we will build a system that allows end-users to just define trigger and action devices, and the system on the background will crowdsource creative scenarios in different categories.
• We have also planned to evaluate the crowd created scenarios from actual owners—smart home inhabitants and IoT vendors.
• In addition to that we will build a recommender system for smart home’s inhabitants that can recommend use case scenarios based on preferences and other traits.

Acknowledgement

• This work was supported by the Mirpur University of Science & Technology (MUST)-10250, Mirpur AJK, Pakistan under award No. 611-19 P.D/2017.
• The first author of this paper was also financially supported by SIGCHI student travel grant for attending CHI 2018 conference.
